

GHG Emissions Dashboard – Peer Review

Reviewed by: Yashaswi Tiwari

Role: Project Manager & Temperature + AQI Owner

Overview

The GHG emissions dashboard presents a structured view of emissions across provinces and sectors, focusing on:

- Emissions trends over time
- Provincial comparison
- Sector-level contribution

The dashboard clearly communicates the overall **declining trend in emissions**, along with variation across Atlantic provinces.

Strengths

The dashboard effectively demonstrates:

- A clear **downward trend in GHG emissions over time**, making the main insight easy to understand
- Strong **sector-wise breakdown**, highlighting major contributors such as energy and fuel-related sectors
- Clean and structured visuals that enable **quick interpretation of provincial and sector differences**
- Consistent use of charts for comparing emissions across:
 - Provinces
 - Years
 - Sectors

👉 Overall, the dashboard communicates **what is happening in emissions clearly and effectively**

Observations

- The analysis primarily focuses on **total emissions and trends**
- The insight is centered around the **decline in emissions over time**
- Sector-level charts provide context for where emissions are coming from
- The narrative explains observed trends but remains **high-level**

Feedback

◆ 1. Limited Analytical Depth

The dashboard clearly shows emission trends but remains largely focused on **describing the data**.

- It shows that emissions are decreasing
- It shows sector contributions

However, the analysis does not go deeper into:

- Differences in reduction patterns across provinces
- Variation between sectors over time

👉 As a result, the insight remains at a **trend-reporting level**

◆ 2. Limited Integration with Other Environmental Factors

The dashboard presents emissions data independently.

- There is no visible connection to:
 - Temperature trends
 - Precipitation patterns
 - AQI behavior

👉 Given the broader project scope, this makes the emissions analysis feel **isolated from other environmental insights**

◆ 3. Explanation Focus (“What” over “Why”)

The dashboard clearly communicates:

- What the emissions trend is

However, it provides limited explanation of:

- Why emissions are decreasing

- What factors may be influencing this trend

👉 The interpretation remains **descriptive rather than exploratory**

◆ 4. Use of Moving Visual Element

The use of a moving KPI card is noticeable in the dashboard.

- Since the data is **historical and static**, the movement does not add analytical value
- It may distract from the interpretation of key metrics

👉 The visual style could be more aligned with the nature of the data

◆ 5. Business and Impact Context

The dashboard presents emissions clearly but does not strongly connect them to:

- Real-world implications
- Environmental impact
- Decision-making or policy outcomes

👉 The insight stops at “trend understanding” rather than extending into “impact understanding”

✅ Final Evaluation

“The GHG dashboard provides a clear and structured representation of emissions trends and sector distribution. It effectively communicates the overall decline in emissions and highlights key contributors. However, the analysis remains primarily descriptive, with limited exploration of underlying patterns, cross-domain relationships, and real-world implications.”

✅ Summary

✓ What works well:

- Clear trend visualization
- Strong sector breakdown
- Clean and readable design

⚠️ What could be strengthened:

- Depth of analysis
- Connection to other environmental data
- Focus on explanation and impact
